Scenario 5 - Firm B defaults in first round, Firm A in second round, MODE == 'MANUAL', NUM\_AGENTS = 3, NOMINAL\_LIABILITY\_MATRIX = np.array([[0,2,9],[7,0,9],[3,1,0]]), OPERATING\_CASHFLOW\_BEFORE\_SHOCK = [11, 8, 12], ALPHA = 0.1, BETA = 0.9

ALPHA and BETA are the fraction of exogenous assets (outside financial network) and endogenous assets (inside financial network i.e. interbank obligations) that are realised on liquidation in the event of default. The two fractions may conceivably be different; we would typically expect that ALPHA would be low, because the bank would be having to sell off its loan portfolio, probably at a knock-down price or fire sale. In contrast, BETA might be much closer to 1, because an obligation from a solvent bank would probably be paid in full (though perhaps with some negotiated discount to compensate for the inconvenience of early repayment).
